

VARIMETER

Current Relay

BA 9053, MK 9053N

Your Advantages

- Preventive maintenance
- For better productivity
- Quicker fault locating
- Precise and reliable

Features

- According to IEC/EN 60 255-1, IEC/EN 60 947-1
- to: monitor DC and AC
- BA 9053 with measuring ranges from 2 mA to 25 A
- BA 9053 optionally with 3 measuring ranges 0.1 up to 25 A
- MK 9053N with measuring ranges from 2 mA up to 10 A
- High overload possible
- Input frequency up to 5 kHz
- Galvanic separation between auxiliary circuit - measuring circuit
- Auxiliary supply AC/DC; BA 9053 with AC
- BA 9053 optionally with start-up delay (MK = standard)
- with time delay, up to max. 100 sec
- BA 9053 optionally with safe separation to IEC/EN 61 140
- MK 9053N optionally with remote potentiometer
- As option with manual reset
- Option with fixed settings possible
- LED indicators for operation and contact position
- MK 9053N as option with pluggable terminal blocks for easy exchange of devices
 - with screw terminals
 - or with cage clamp terminals
- Width BA 9053: 45 mm
- Width MK 9053N: 22.5 mm

Circuit Diagrams

BA 9053

BA 9053/4__ z. B.:
 Terminals i1/k: 0.1 ... 1 A
 Terminals i2/k: 0.5 ... 5 A
 Terminals i3/k: 1 ... 10 A

MK 9053N

MK 9053N/1__

Connection Terminals

Terminal designation	Signal designation
A1, A2	Auxiliary voltage
i, k	Current measuring input
11, 12, 14	1st changeover contact
21, 22, 24	2nd changeover contact
at MK 9053/1__: Z1, Z2, Z3	Remote potentiometer for response value

Safety Notes

Please observe when connecting a remote potentiometer to MK 9053N/1__:

Measuring circuit and remote potentiometer not galvanically separated. The voltage on on measuring circuit i, k / PE has connection to the remote potentiometer. The remote potentiometer has to be connected volt- and ground-free.

Approvals and Markings

* see variants

Applications

- Monitoring current in AC or DC systems
- For industrial and railway applications

Function

The relays measure the arithmetic mean value of the rectified measuring current. The AC units are adjusted to the r.m.s value. They have settings for response value and hysteresis. The units work as overcurrent relays but can also be used for undercurrent detection. The hysteresis is dependent on the response value.

2 time delays are possible in different variants:

The start up delay t_a operates only when connecting the auxiliary supply. It disables tripping e.g. caused by an increased starting current of a motor. The response delay t_v is active after exceeding a response value. On overcurrent relays the delay is active when the current goes over the tripping value, on undercurrent relays when the current drops below the hysteresis value.

Indicators

- green LED: on, when auxiliary supply connected
- yellow LED: on, when output relay activated

Function Diagram without Start-up Delay

Function Diagram with Start-up Delay

On model BA 9053/6_ _ with manual reset the contacts remain in the fault state after detecting a fault or after t_o has elapsed. The contacts are reset by disconnecting the supply voltage.

* DC or AC current 50 ... 5000 Hz
(Other frequency ranges of 10 ... 5000 Hz, e.g. 16 ²/₃ Hz on request)

Extending of measuring range:

For DC-current higher then the highest measuring range the voltage relay BA 9054 or MK 9054N measuring range 15 ... 150 mV or 6 ... 60 mV can be used with external Shunt.
For AC current higher then the highest measuring range can be used a current transformer e. g. with secondary winding of 1 A or 5 A together with BA 9053 or MK 9053N. The nominal load of the CT should be ≥ 0.5 VA.

Measuring principle:

arithmetic mean value

Adjustment:

The AC - devices can also monitor DC current. The scale offset in this case is:

$$(I = 0.90 I_{\text{eff}})$$

Temperature influence:

$$< 0.05 \% / K$$

• Width: 22.5 mm

Ordering Example for Variants

Options with Pluggable Terminal Blocks

Screw terminal
(PS/plugin screw)

Cage clamp
(PC/plugin cage clamp)

Notes

Removing the terminal blocks with cage clamp terminals

1. The unit has to be disconnected.
2. Insert a screwdriver in the side recess of the front plate.
3. Turn the screwdriver to the right and left.
4. Please note that the terminal blocks have to be mounted on the belonging plug in terminations.

Accessories

AD 3: Remote potentiometer 470 K Ω
Article number: 0050174

Setting

Example:
Current relay BA 9053 / MK 9053N AC 0.5 ... 5 A

AC according to type plate:
i.e. the unit is calibrated for AC
0.5 ... 5 A = measuring range

Response value AC 3 A
Hysteresis AC 1.5 A

Settings:
upper potentiometer: 0.6 (0.6 x 5 A = 3 A)
lower potentiometer: 0.5 (0.5 x 3 A = 1.5 A)

The AC - devices can also monitor DC current. The scale offset in this case is: $\bar{I} = 0.90 \times I_{\text{eff}}$

AC 0.5 ... 5 A is equivalent to DC 0.45 ... 4.5 A

Response value DC 3 A
Hysteresis DC 1.5 A

Settings:
upper potentiometer: 0.66 (0.66 x 4.5 A = 3 A)
lower potentiometer: 0.5 (0.5 x 3 A = 1.5 A)

M11504 a

Time delay of measuring circuit

X on: Measured value rise $F = \frac{\text{Measured value (after rise of measured value)}}{\text{Setting value}}$

X off: Measured value drops $F = \frac{\text{Measured value (before measured value drops)}}{\text{Setting value (hysteresis)}}$

The diagram shows the typical delay of a standard devices depending on the measured values "X on and X off" at sudden rise or drop of the signal. At slow change of the measured value the delay is shorter. The total reaction time of the device results from the adjustable delay t_d and the delay created by the measuring circuit.

The diagram shows an average delay. The delay times could differ on the different variants.

Example for "X on" (overcurrent detection with BA9053/010):

Adjusted setting value X on = 2 A.

Due to a stalled motor the current rises suddenly to 10 A.

$$F = \frac{\text{Measured value (after rise of measured value)}}{\text{Setting value}} = \frac{10 \text{ A}}{2 \text{ A}} = 5$$

Reading from the diagram:

The output relay switches on after 31 ms at a setting $t_d=0$.

Example for "X off" (undercurrent detection with BA9053/012):

Adjusted hysteresis setting value is 10 A.

The current drops suddenly from 23 A to 0 A.

$$F = \frac{\text{Measured value (before measured value drops)}}{\text{Setting value (hysteresis)}} = \frac{23 \text{ A}}{10 \text{ A}} = 2.3$$

Reading from the diagram:

The output relay switches off after 70 ms at a setting $t_d=0$.
